## EMPIRICAL AND NOT-SO-EMPIRICAL CORRELATIONS HOLDING FOR ${}^2J({}^{29}\text{Si}-\text{O}-{}^{29}\text{Si})$ COUPLINGS IN INDUSTRIALLY IMPORTANT SILOXANES

Jan Schraml, Milan Kurfürst and Vratislav Blechta

*Institute of Chemical Processes Fundamental of the ASCR, v.v.i, 16502 Prague 6, Czech  
Republic*

A large number (78) of  ${}^2J({}^{29}\text{Si}-\text{O}-{}^{29}\text{Si})$  coupling constants (range 0.4 - 9 Hz) has been determined in siloxanes with different degrees of branching and different substituents. The signs of these couplings were determined for representative model compounds.[1] It was found that all these couplings are positive. In contrast, quantum mechanical calculations (MP2/6-31g\*\* optimized structures, B3LYP/IgloIII J-calculation) yielded negative couplings. Hence our discussion is limited to empirical correlations though some rest on reasonable theoretical bases.
